Problem Statement

- Sales growth along with the dependency of the current information system has resulted in the owner of the Max needing a sustainable information system for inventory and ordering purposes.
- No electronic inventory system in place right now. The inventory system is currently pen and paper and only performed by the owner, which allows for errors to happen during the liquor ordering process.
- The requester would like an electronic information system to simplify the process, in addition to making the process possible for someone besides himself to complete, in case of an emergency.

Service Request

- The customer would like a new information system designed and built to improve the efficiency of the current information system.
- The system should allow the user to view the amount of liquor in inventory, in addition to adding to the inventory when a delivery is made by a distributor.
- This system should also enable the user view the quantity of each individual liquor to be ordered and should output the list, organized by liquor distributors.

Our Solution

- Our proposed solution for the client is a Microsoft Access based database with an easy to use GUI. The GUI will allow the user to modify inventory numbers and view current inventory levels. The GUI will also be able to tell the user how much liquor will needed to be purchased for the next order.
